They say the answer is hidden in the question. So how is it that we simply can't solve existence?

Current attempts currently don't come close

No; science, physics, medicine, quantum mechanics, are a dead-end! There just isn't any way such insignificant topics can solve our crisis.

All these deadends do is lead us down a path of reductionism. Do you think that if you identified the smallest fundamental unit, or better understood space-time, you'll get anywhere? The answer is you'll be right back where you started.

Now what if I could grant you authority over truth, could you solve existence? If you can't answer that then it shows the failure of our science. There is no fundamental in which science can currently answer that question but today we'll ask the right questions. Lets drop all expectations and don't assume simple questions can't be the fundamental ones; because they are.

Pretext: Lets say a 2D game character had counsiousness and could think. How would you describe to the 2D character that there exists a third? "nono, it's to your right! and it has depth!" "right is not a concept, only forward and back, and there exists no half way point between forward and back; there is no way (literally)"

> There is no way (literally)

Now consider existence.

- "There is no way (literally)"

Now we will commit 'ask' knowing we are missing a key (extra dimension).

In all my life, my crisis boils down to these fundamental questions. Any and all answers will break existence.

1. Why is there everything and not nothing? But it would make no sense if there was nothing without something! But it would make no sense if there was something without everything!

Solving without answering: there exists a dimension where it allows everything, nothing, and something to co-exist.
